## Introduction

### 1.1 What is Data Science?

#### Definition 1.1: Data Science

Data Science is an interdisciplinary field that extracts knowledge from data to support decisions. It combines statistics, mathematics, computer science, and domain expertise to collect, clean, manage, and analyse data.

### 1.2 The Data Science lifecycle

A project moves through business understanding, data engineering, model engineering, deployment, and monitoring. This cycle can repeat when new data or retraining is needed.

## 1.3 Artificial Intelligence and Machine Learning

*Artificial Intelligence* (AI) studies how to build systems that perform tasks requiring abilities such as reasoning, learning, and problem solving.

### Definition 1.2: Machine Learning

Machine Learning (ML) studies algorithms whose performance  $P$  on a task  $T$  improves through experience  $E$ . A learning problem therefore specifies the task, the performance measure, and the available experience.

The main learning settings are:

- **Supervised learning:** learn from inputs paired with known desired outputs to predict the output for new inputs.
- **Unsupervised learning:** discover structure in data without given target outputs.
- **Reinforcement learning:** learn how to act through interaction with an environment and feedback in the form of rewards.

## What is ML (Machine Learning)

**Artificial Intelligence** is the field of computer science dedicated to creating agents capable of performing tasks that typically require human intelligence such as learning reasoning and problem solving.

*AI, ML, and learning settings. Source: Spinelli, Lecture 00.*

*Deep learning* uses neural networks with multiple layers and can be applied in each of these settings.
